My steps to get a nice result using “Print on Stones” Dinasset’s filter.

I get a nice image.

I adapt the measure of the image in such a way that width and height can be divisible of 200. Good measures can be: 1600*1200; 1200*1200; 800*600 etc.

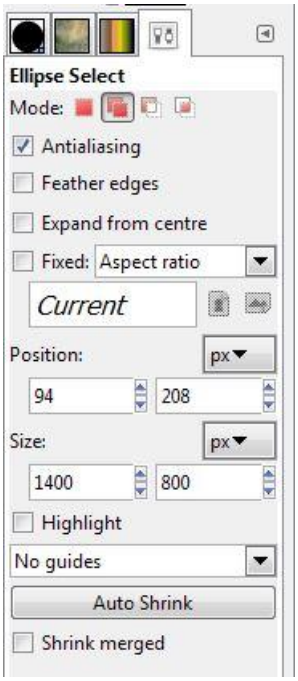

I have this image which is 1600*1200:

Go to Filters-Diego-Artistic-PrintOnStones2 and you make a selection in the center of the image. In this one I did an oval selection:

My selection has these measures:

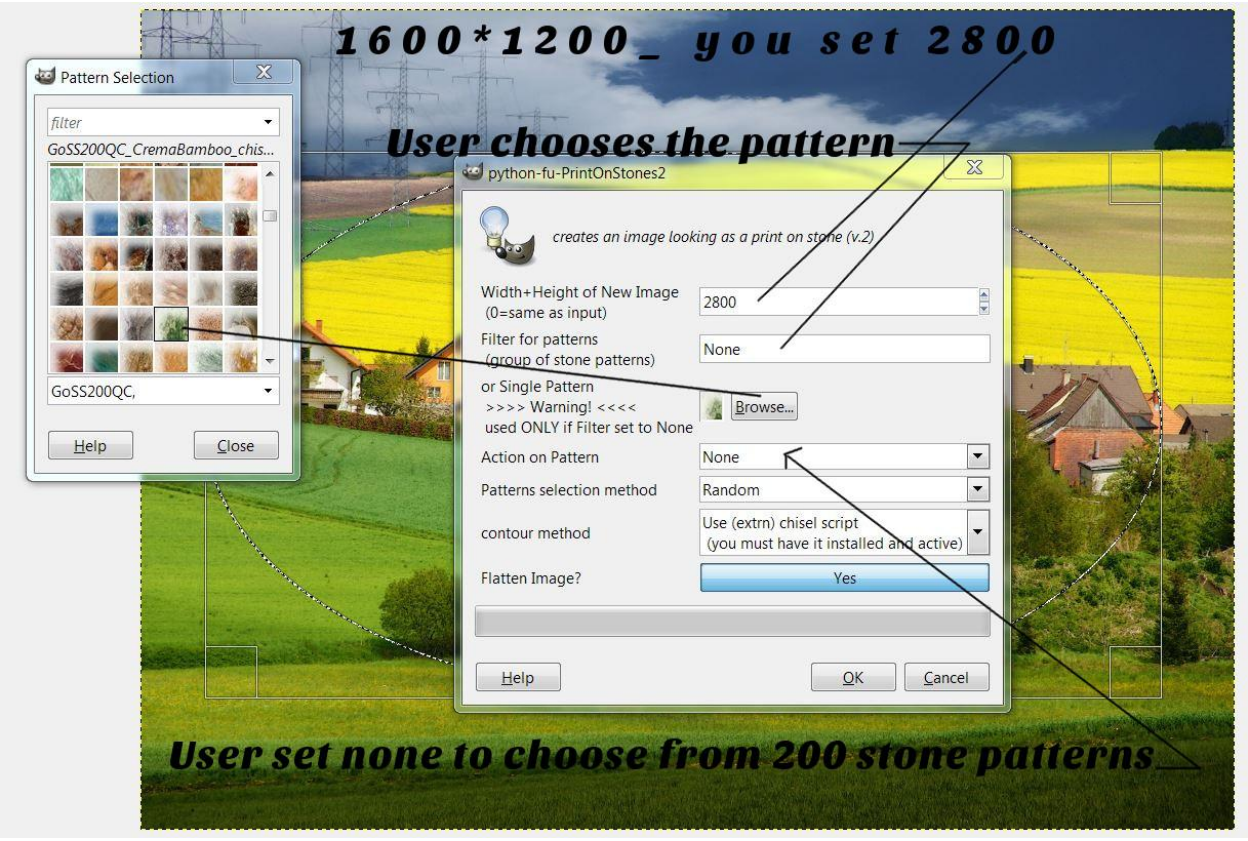

How you can see, the selection has 1400*800

This selection measure is good because if you want to apply a 200 stone tile pattern, the result will be tiled in a perfect centered shape. If you don't pay attention to that, the tiled result will have halves tiles into the selection.

But if you want a no tiled result, you can make any form of selection and shapes. These results will be from any 1000 stone patterns, or from whose you have in your pattern folder under selection.

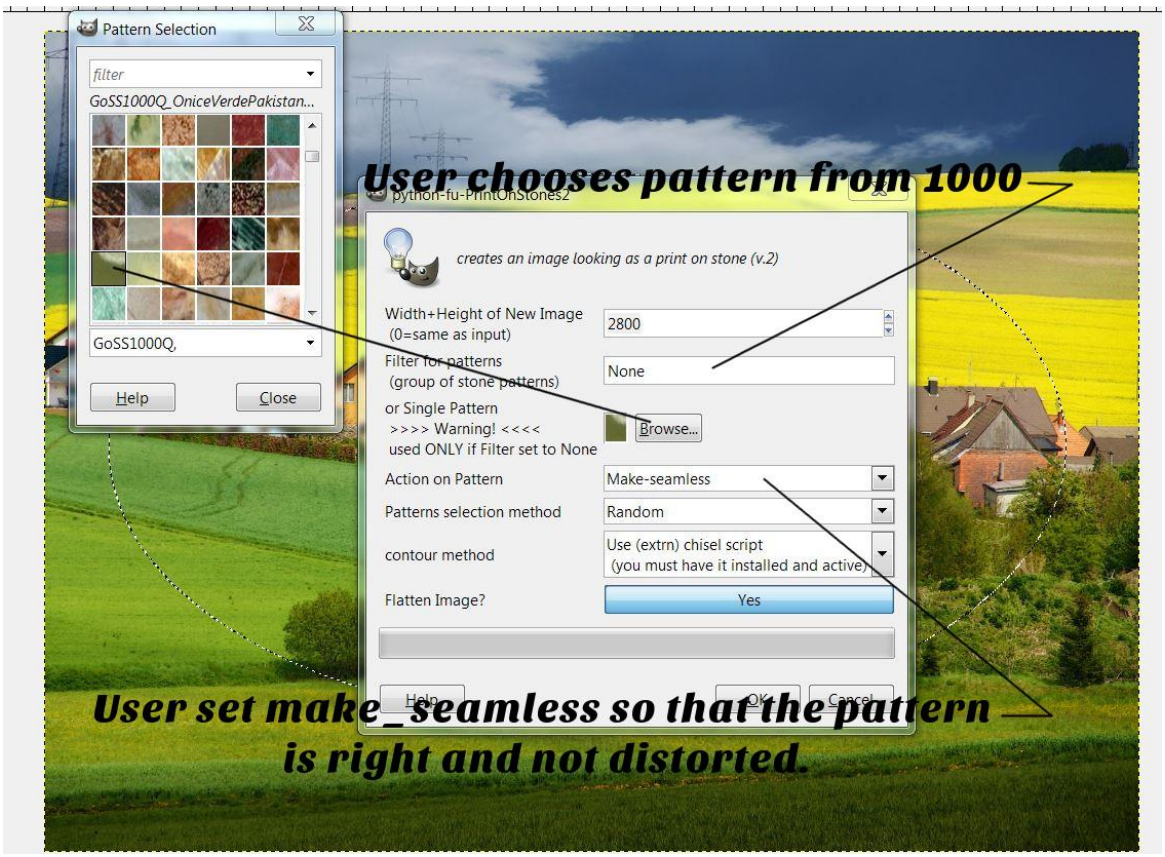

Our selection using the filter to get a tiled result.

The result after running the filter: Look at the tiles are centered.

Now the user wants to get a not tiled result: The settings will be;

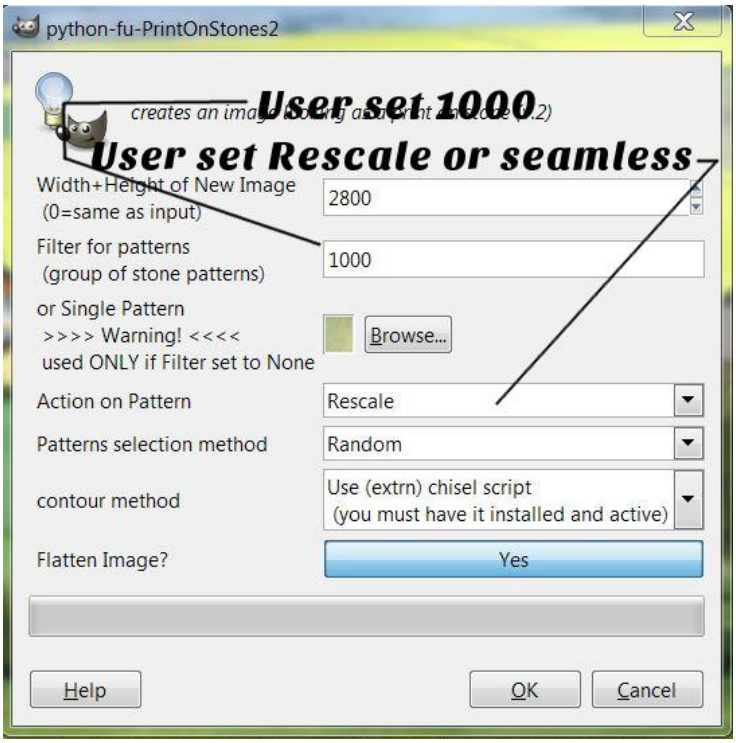

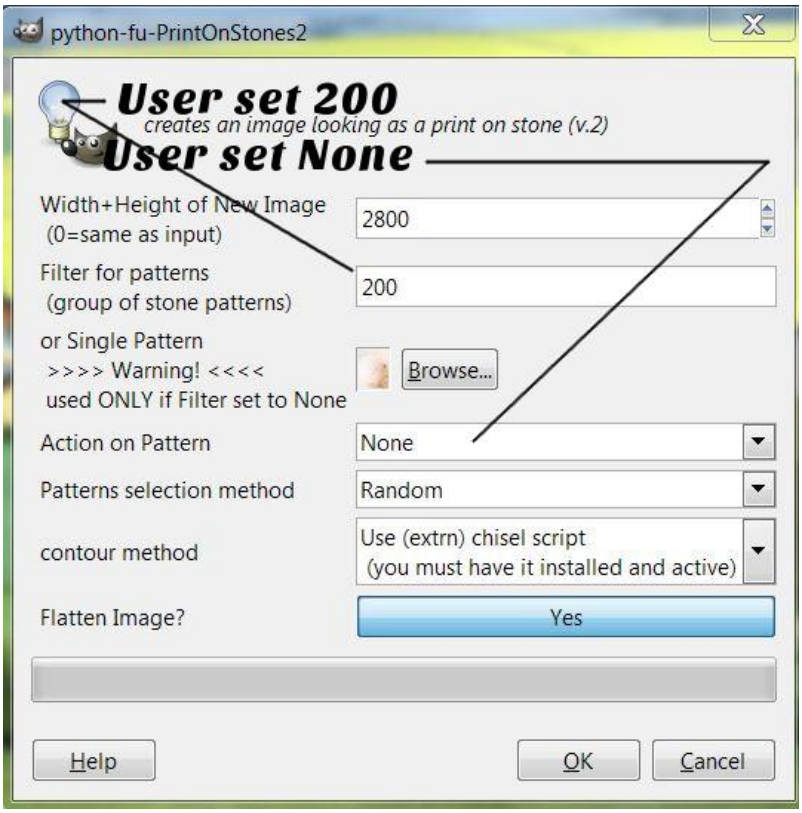

The result:

However, the user can choose the option that the **filter chooses the pattern from 200 or 1000 by itself**.

Then only there is necessary to set 200 or 1000 into the little window in the filter and None (for 200) or rescale or make seamless:

I hope this explanation can be useful.

Enjoy this nice filter.
