How to create a tremor text

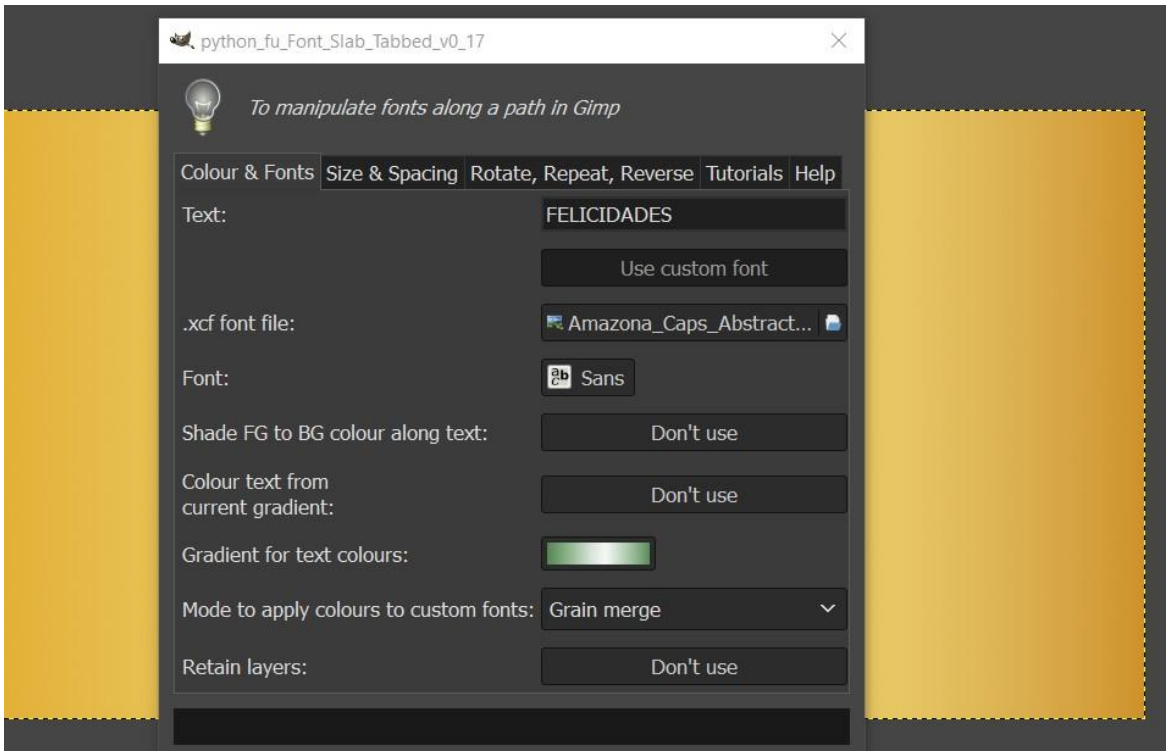

Open a 1000*500 canvas

Apply gradient or pattern or simple colour

Create a path for the text.

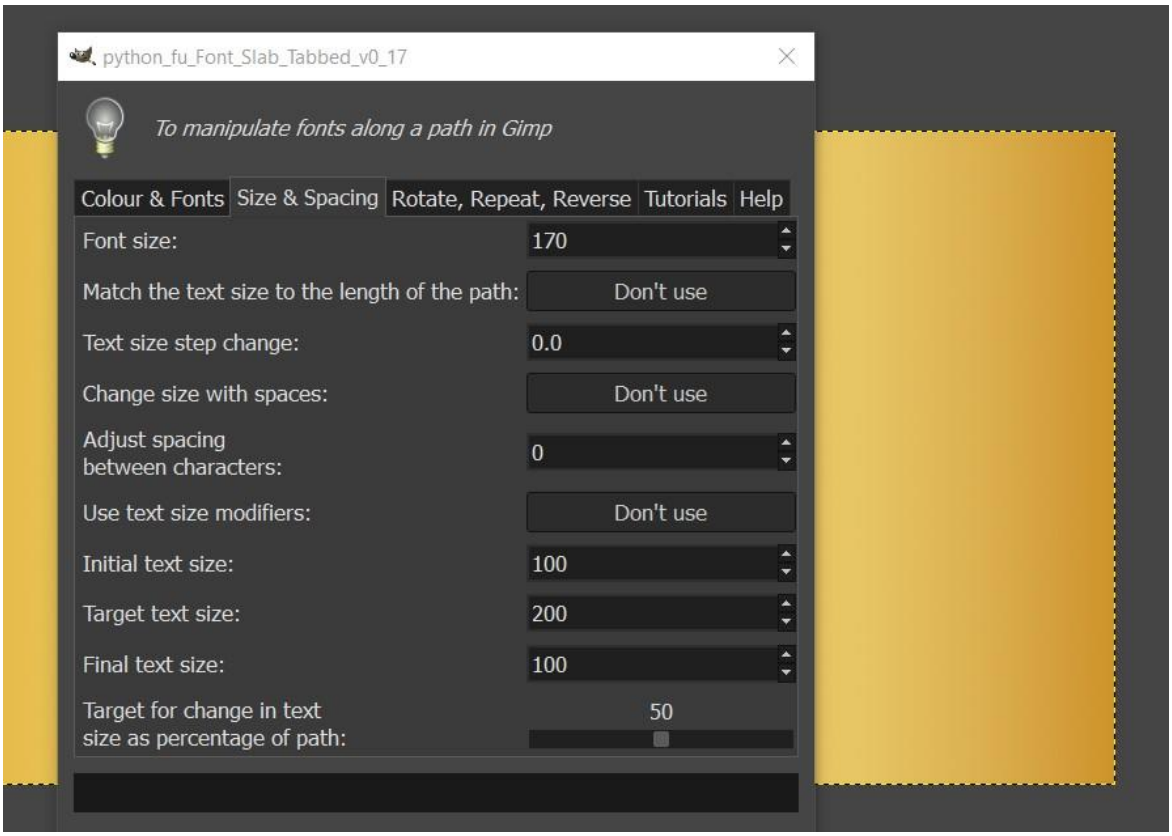

Go to Filters – Call up the FontSlab plug-in: Filters>>Custom Fonts>>Using Tools>>Font Slab Tabbed v0.17

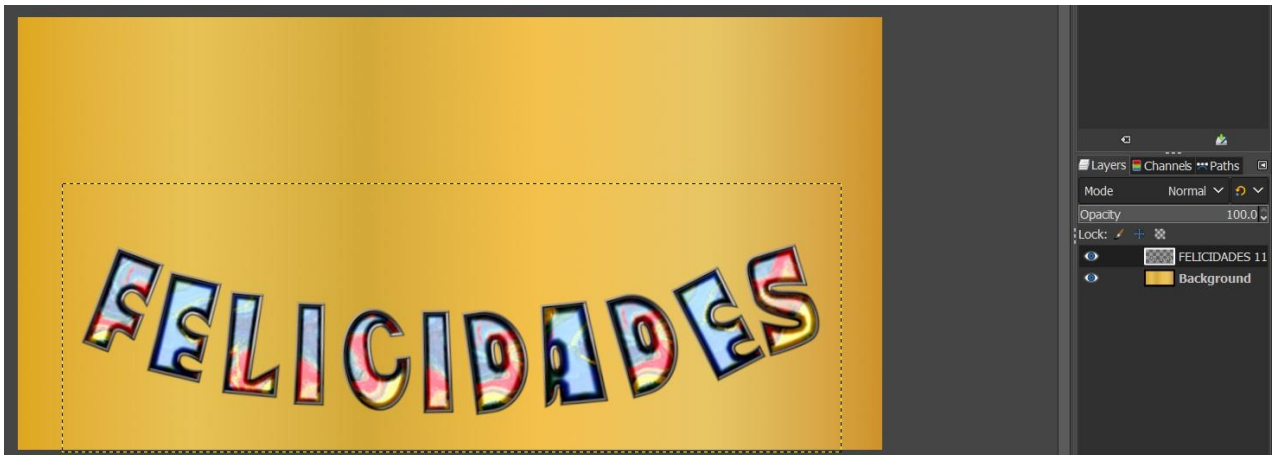

Write your text or use a custom font. (see the shot)

Then click on Size & Spacing

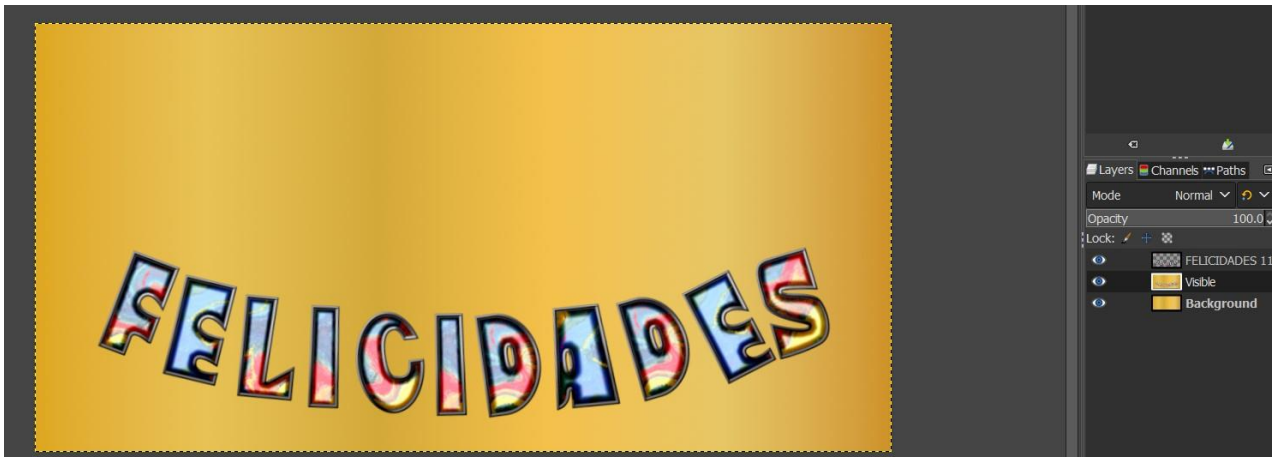

Adjust the size and set Text size step change at 0. Accept.

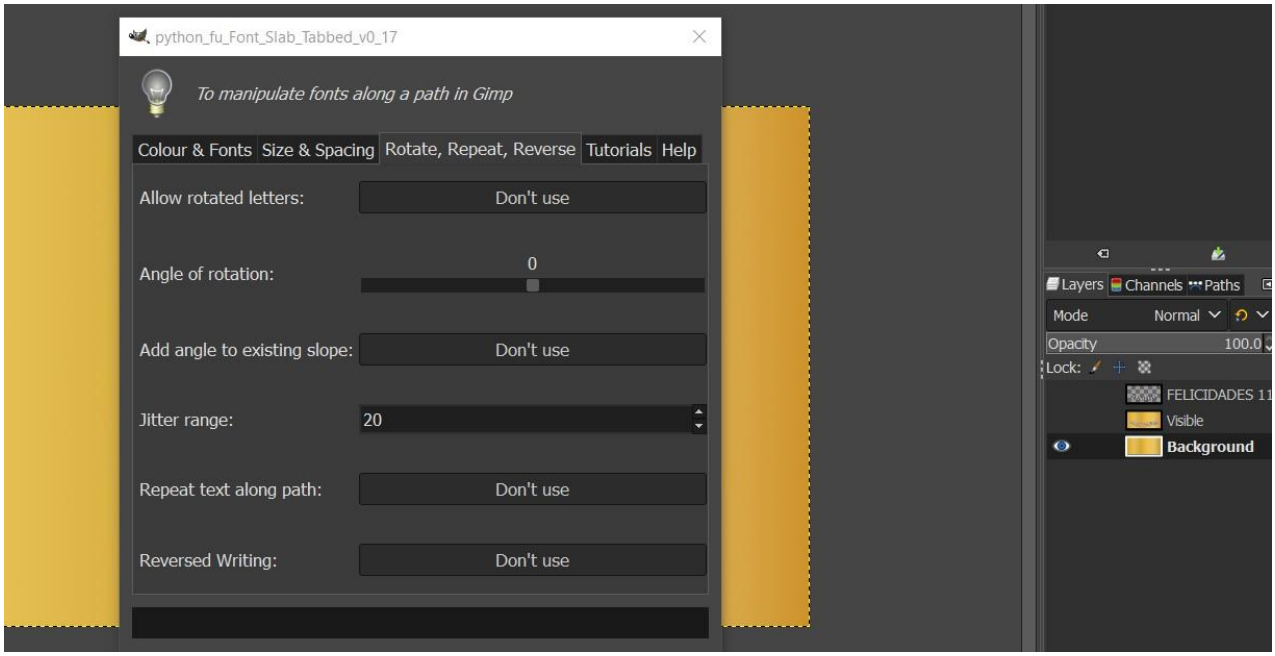

We have 2 layers now.

New from Visible and set it on background.

Close eyes except background layer. Select background layer.

Call up the filter again and open Rotate Tab. Set Jitter range at 20.

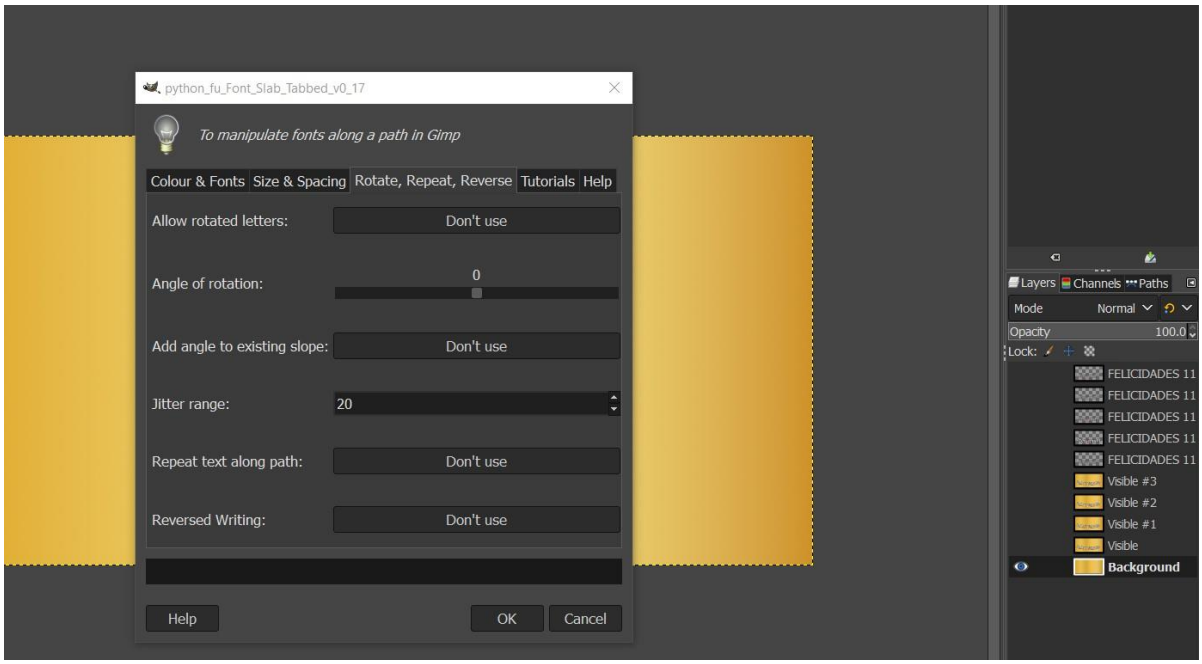

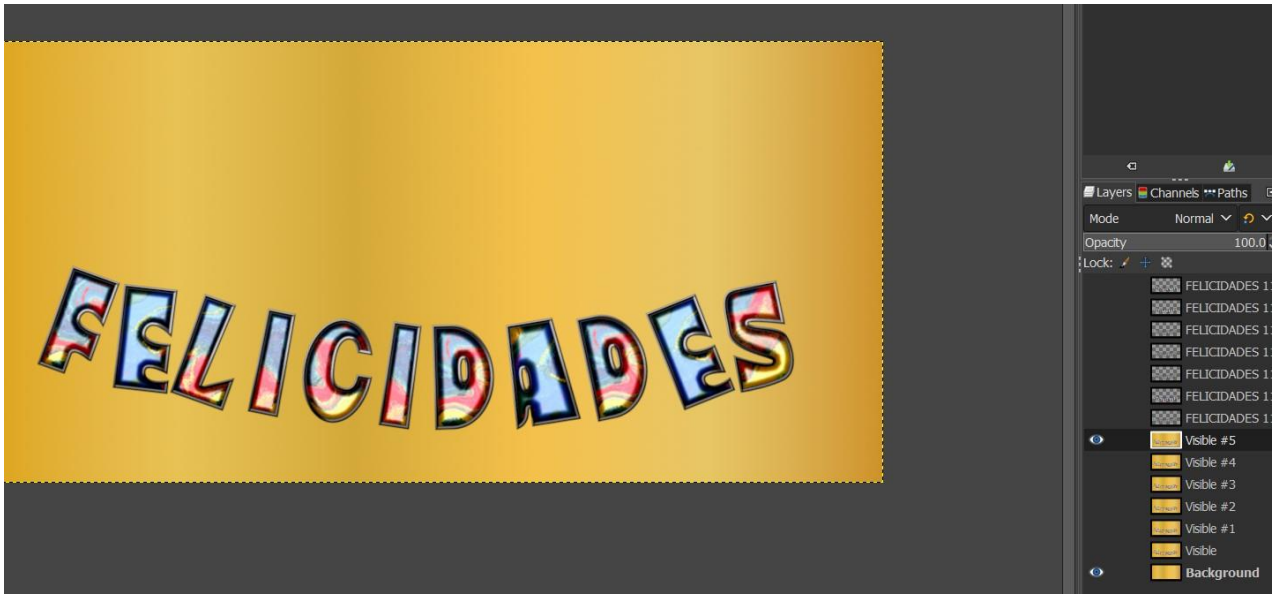

The bigger number at Jitter, the more intense the tremor will be.

Now New from visible.

Close the eyes except background layer and call up the filter to repeat the effect.

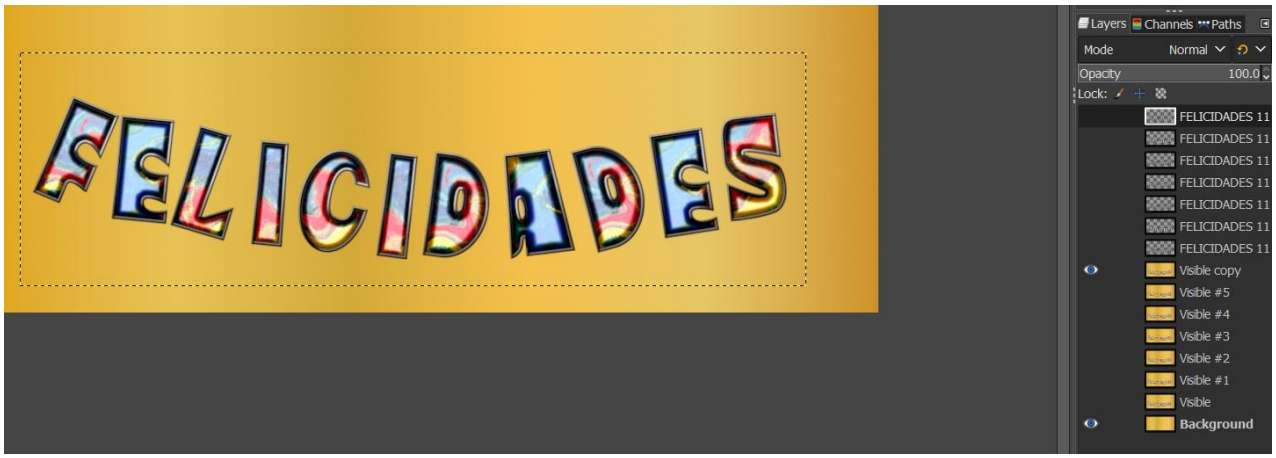

Make this 6 times.

When you get the 6 visible layers (see the shot) You can remove the top text layers.

Now make a copy from the first visible layer and set it upper the stock.

Edit the layer attributes and add (1000ms) to the upper copy layer.

Remove the background layer.

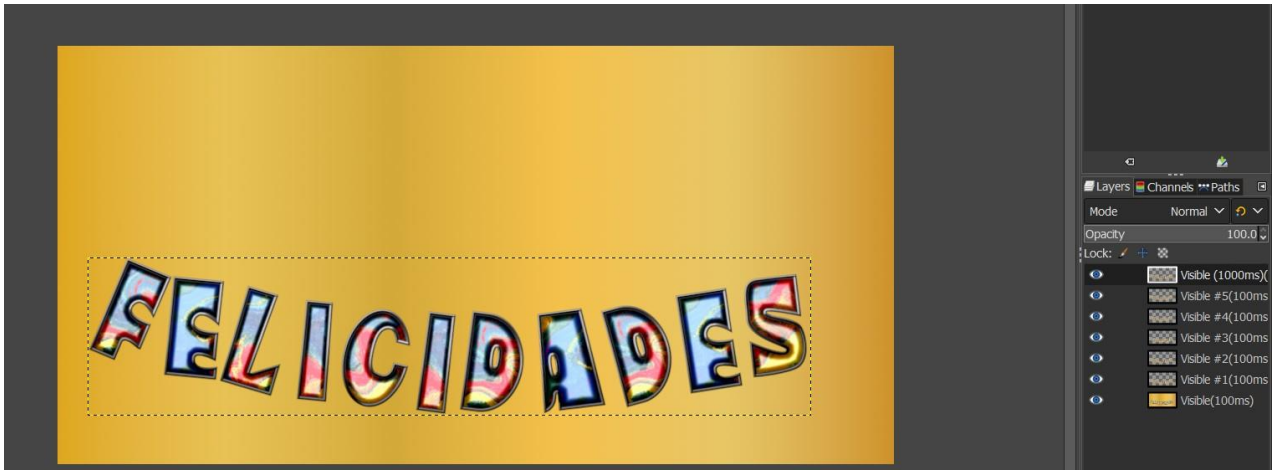

Check the tremor effect by going to filters – animation – playback

If everything is alright,

Go to Filters – animation – optimize for gif.

File – Export as and save it as gif extension click as animation. Accept.

Issa,
